HAND ARM VIBRATION EXPOSURE

The table below is a 'ready reckoner' used for calculating daily vibration exposures. It covers a range of vibration magnitudes up to 40 m/s² A(8) and a range of exposure times up to 10 hours.

The exposures for different combinations of vibration magnitude and exposure time are given in exposure points instead of values in m/s² A(8). You may find the exposure points easier to work with than the A(8) values:

Exposure points change simply with time: twice the exposure time, twice the number of points.

Exposure points can be added together, for example where a worker is exposed to two or more different sources of vibration in a day.

The exposure action value (2.5 m/s² A(8)) is equal to 100 points.

The exposure limit values (5 m/s² A(8)) is equal to 400 points.

WORKING SAFELY AT A HEIGHT

When working at a height, you must make sure work is properly planned, supervised and carried out by competent people with the skills, knowledge and experience to do the job. You must use the right type of equipment for working at height.

Take a sensible approach when considering precautions. Low-risk, relatively straightforward tasks will require less effort when it comes to planning and there may be some low-risk situations where common sense tells you no particular precautions are necessary.

CONTROL MEASURES

First assess the risks. Factors to weigh up include the height of the task, the duration and frequency, and the condition of the surface being worked on.

Before working at height work through these simple steps:

- Avoid work at height where it's reasonably practicable to do so.
- Where work at height cannot be easily avoided, prevent falls using either an existing place of work that is already safe or the right type of equipment.
- Minimise the distance and consequences of a fall, by using the right type of equipment where the risk cannot be eliminated.

For each step, always consider measures that protect everyone at risk (collective protection) before measures that only protect the individual (personal protection).

Collective protection is equipment that does not require the person working at height to act for it to be effective. Examples are permanent or temporary guardrails, scissor lifts and tower scaffolds.

Personal protection is equipment that requires the individual to act for it to be effective. An example is putting on a safety harness correctly and connecting it, with an energy-absorbing lanyard, to a suitable anchor point.

In such circumstances, the Customer shall return the Hire Goods to the Supplier on the final day of the 3 month Hire Period. 3 FAULTY GOODS AND/OR SERVICES

4.6 The Supplier may set a reasonable credit limit for the Customer. The Supplier reserves the right to terminate or suspend the Contract for hire of the Hire Goods and/or the provision of Services if allowing it to continue would result in the Customer exceeding its credit limit or the credit limit is already exceeded.
